

FSGM0565RB

Green-Mode Power Switch

Description

The FSGM0565RB is an integrated Pulse Width Modulation (PWM) controller and SENSEFET[®] specifically designed for offline Switch-Mode Power Supplies (SMPS) with minimal external components. The PWM controller includes an integrated fixed-frequency oscillator, Under-Voltage Lockout (UVLO), Leading-Edge Blanking (LEB), optimized gate driver, internal soft-start, temperature-compensated precise current sources for loop compensation, and self-protection circuitry. Compared with a discrete MOSFET and PWM controller solution, the FSGM series can reduce total cost, component count, size, and weight; while simultaneously increasing efficiency, productivity, and system reliability. This device provides a basic platform suited for cost-effective design of a flyback converter.

Features

- Soft Burst-Mode Operation for Low Standby Power Consumption and Low Noise
- Precision Fixed Operating Frequency: 66 kHz
- Pulse-by-Pulse Current Limit
- Various Protection Functions: Overload Protection (OLP), Over-Voltage Protection (OVP), Abnormal Over-Current Protection (AOCP), Internal Thermal Shutdown (TSD) with Hysteresis, Output-Short Protection (OSP), and Under-Voltage Lockout (UVLO) with Hysteresis
- Auto-Restart Mode
- Internal Startup Circuit
- Internal High-Voltage SENSEFET: 650 V
- Built-in Soft-Start: 15 ms
- These Devices are Pb-Free and are RoHS Compliant

Applications

- Power Supply for LCD TV and Monitor, STB and DVD Combination

PIN DEFINITIONS

Pin No.	Name	Description
1	Drain	<i>SENSEFET Drain.</i> High-voltage power SENSEFET drain connection.
2	GND	<i>Ground.</i> This pin is the control ground and the SENSEFET source.
3	V _{CC}	<i>Power Supply.</i> This pin is the positive supply input, which provides the internal operating current for both startup and steady-state operation.
4	FB	<i>Feedback.</i> This pin is internally connected to the inverting input of the PWM comparator. The collector of an opto-coupler is typically tied to this pin. For stable operation, a capacitor should be placed between this pin and GND. If the voltage of this pin reaches 6 V, the overload protection triggers, which shuts down the power switch.
5	N.C.	No connection.
6	V _{STR}	<i>Startup.</i> This pin is connected directly, or through a resistor, to the high-voltage DC link. At startup, the internal high-voltage current source supplies internal bias and charges the external capacitor connected to the V _{CC} pin. Once V _{CC} reaches 12 V, the internal current source (I _{CH}) is disabled.

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Max	Unit	
V _{STR}	V _{STR} Pin Voltage	–	650	V	
V _{DS}	Drain Pin Voltage	–	650	V	
V _{CC}	V _{CC} Pin Voltage	–	26	V	
V _{FB}	Feedback Pin Voltage	–0.3	12.0	V	
I _{DM}	Drain Current Pulsed	–	11	A	
I _{DS}	Continuous Switching Drain Current (Note 6)	T _C = 25°C	–	5.6	A
		T _C = 100°C	–	3.4	A
E _{AS}	Single Pulsed Avalanche Energy (Note 7)	–	295	mJ	
P _D	Total Power Dissipation (T _C = 25°C) (Note 8)	–	45	W	
T _J	Maximum Junction Temperature	–	150	°C	
	Operating Junction Temperature (Note 9)	–40	+125	°C	
T _{STG}	Storage Temperature	–55	+150	°C	
V _{ISO}	Minimum Isolation Voltage (Note 10)	2.5	–	kV	
ESD	Electrostatic Discharge Capability	Human Body Model, JESD22-A114	2	–	kV
		Charged Device Model, JESD22-C101	2	–	kV

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

6. Repetitive peak switching current when the inductive load is assumed: Limited by maximum duty (D_{MAX} = 0.75) and junction temperature (see Figure 4).

7. L = 45mH, starting T_J = 25°C.

8. Infinite cooling condition (refer to the SEMI G30-88).

9. Although this parameter guarantees IC operation, it does not guarantee all electrical characteristics.

10. The voltage between the package back side and the lead is guaranteed.

Protection Circuits

The FSGM0565RB has several self-protective functions, such as Overload Protection (OLP), Abnormal Over-Current Protection (AOCP), Output-Short Protection (OSP), Over-Voltage Protection (OVP), and Thermal Shutdown (TSD). All the protections are implemented as auto-restart. Once the fault condition is detected, switching is terminated and the SENSEFET remains off. This causes V_{CC} to fall. When V_{BCC} falls to the Under-Voltage Lockout (UVLO) stop voltage of 7.5 V, the protection is reset and the startup circuit charges the V_{CC} capacitor. When V_{CC} reaches the start voltage of 12.0 V, the FSGM0565RB resumes normal operation. If the fault condition is not removed, the SENSEFET remains off and V_{CC} drops to stop voltage again. In this manner, the auto-restart can alternately enable and disable the switching of the power SENSEFET until the fault condition is eliminated. Because these protection circuits are fully integrated into the IC without external components, the reliability is improved without increasing cost.

Figure 19. Auto-Restart Protection Waveforms

Overload Protection (OLP)

Overload is defined as the load current exceeding its normal level due to an unexpected abnormal event. In this situation, the protection circuit should trigger to protect the SMPS. However, even when the SMPS is in normal operation, the overload protection circuit can be triggered during the load transition. To avoid this undesired operation, the overload protection circuit is designed to trigger only after a specified time to determine whether it is a transient situation or a true overload situation. Because of the pulse-by-pulse current limit capability, the maximum peak current through the SENSEFET is limited and, therefore, the maximum input power is restricted with a given input voltage. If the output consumes more than this maximum power, the output voltage (V_{OUT}) decreases below the set voltage. This reduces the current through the opto-coupler LED, which also reduces the opto-coupler transistor

current, thus increasing the feedback voltage (V_{FB}). If V_{FB} exceeds 2.4 V, D1 is blocked and the 3.3 μ A current source starts to charge C_{FB} slowly up. In this condition, V_{FB} continues increasing until it reaches 6.0 V, when the switching operation is terminated, as shown in Figure 20. The delay time for shutdown is the time required to charge C_{FB} from 2.4 V to 6.0 V with 3.3 μ A. A 25 ~ 50 ms delay is typical for most applications. This protection is implemented in auto-restart mode.

Figure 20. Overload Protection

Abnormal Over-Current Protection (AOCP)

When the secondary rectifier diodes or the transformer pins are shorted, a steep current with extremely high di/dt can flow through the SENSEFET during the minimum turn-on time. Even though the FSGM0565RB has overload protection, it is not enough to protect the FSGM0565RB in that abnormal case; since severe current stress is imposed on the SENSEFET until OLP is triggered. The FSGM0565RB internal AOCP circuit is shown in Figure 21. When the gate turn-on signal is applied to the power SENSEFET, the AOCP block is enabled and monitors the current through the sensing resistor. The voltage across the resistor is compared with a preset AOCP level. If the sensing resistor voltage is greater than the AOCP level, the set signal is applied to the S-R latch, resulting in the shutdown of the SMPS.

Figure 21. Abnormal Over-Current Protection

Output-Short Protection (OSP)

If the output is shorted, steep current with extremely high di/dt can flow through the SENSEFET during the minimum turn-on time. Such a steep current brings high-voltage stress on the drain of the SENSEFET when turned off. To protect the device from this abnormal condition, OSP is included. It is comprised of detecting V_{FB} and SENSEFET turn-on time. When the V_{FB} is higher than 2 V and the SENSEFET turn-on time is lower than 1.2 μ s, the FSGM0565RB recognizes this condition as an abnormal error and shuts down PWM switching until V_{CC} reaches V_{START} again. An abnormal condition output short is shown in Figure 22.

Figure 22. Output-Short Protection

Over-Voltage Protection (OVP)

If the secondary-side feedback circuit malfunctions or a solder defect causes an opening in the feedback path, the current through the opto-coupler transistor becomes almost zero. Then V_{FB} climbs up in a similar manner to the overload situation, forcing the preset maximum current to be supplied to the SMPS until the overload protection is triggered. Because more energy than required is provided to the output, the output voltage may exceed the rated voltage before the overload protection is triggered, resulting in the breakdown of the devices in the secondary side. To prevent this situation, an OVP circuit is employed. In general, the V_{CC} is proportional to the output voltage and the FSGM0565RB uses V_{CC} instead of directly monitoring the output voltage. If V_{CC} exceeds 24.5 V, an OVP circuit is triggered, resulting in the termination of the switching operation. To avoid undesired activation of OVP during normal operation, V_{CC} should be designed to be below 24.5 V.

Thermal Shutdown (TSD)

The SENSEFET and the control IC on a die in one package makes it easier for the control IC to detect the over temperature of the SENSEFET. If the temperature exceeds $\sim 140^{\circ}\text{C}$, the thermal shutdown is triggered and the FSGM0465R stops operation. The FSGM0465R operates in auto-restart mode until the temperature decreases to around 110°C , when normal operation resumes.

Soft Burst-Mode Operation

To minimize power dissipation in standby mode, the FSGM0465R enters burst-mode operation. As the load decreases, the feedback voltage decreases. As shown in Figure 23, the device automatically enters burst mode when the feedback voltage drops below V_{BURL} (400 mV). At this point, switching stops and the output voltages start to drop at a rate dependent on standby current load. This causes the feedback voltage to rise. Once it passes V_{BURH} (600 mV), switching resumes. At this point, the drain current peak increases gradually. This soft burst-mode can reduce audible noise during burst-mode operation. The feedback voltage then falls and the process repeats. Burst-mode operation alternately enables and disables switching of the SENSEFET, thereby reducing switching loss in standby mode.

Figure 23. Burst-Mode Operation

FSGM0565RB

TYPICAL APPLICATION CIRCUIT

Application	Input Voltage	Rated Output	Rated Power
LCD TV, Monitor Power Supply	390 V _{DC}	5.0 V (4 A) 12.0 V (4 A)	68 W

Key Design Notes:

1. The delay time for overload protection is designed to be about 25 ms with C105 (22 nF). OLP time between 25 ms (22 nF) and 50 ms (43 nF) is recommended.

2. The SMD-type capacitor (C106) must be placed as close as possible to the V_{CC} pin to avoid malfunction by abrupt pulsating noises and to improve ESD and surge immunity. Capacitance between 100 nF and 220 nF is recommended.

DESCRIPTION:	TO-220-6LD LF	PAGE 1 OF 1

onsemi and ONSEMI are trademarks of Semiconductor Components Industries, LLC dba onsemi or its subsidiaries in the United States and/or other countries. onsemi reserves the right to make changes without further notice to any products herein. onsemi makes no warranty, representation or guarantee regarding the suitability of its products for any particular purpose, nor does onsemi assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. onsemi does not convey any license under its patent rights nor the rights of others.

onsemi, **Onsemi**, and other names, marks, and brands are registered and/or common law trademarks of Semiconductor Components Industries, LLC dba "**onsemi**" or its affiliates and/or subsidiaries in the United States and/or other countries. **onsemi** owns the rights to a number of patents, trademarks, copyrights, trade secrets, and other intellectual property. A listing of **onsemi**'s product/patent coverage may be accessed at www.onsemi.com/site/pdf/Patent-Marking.pdf. **onsemi** reserves the right to make changes at any time to any products or information herein, without notice. The information herein is provided "as-is" and **onsemi** makes no warranty, representation or guarantee regarding the accuracy of the information, product features, availability, functionality, or suitability of its products for any particular purpose, nor does **onsemi** assume any liability arising out of the application or use of any product or circuit, and specifically disclaims any and all liability, including without limitation special, consequential or incidental damages. Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
